The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping expressed genes. (I) is useful in gene therapy techniques of for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and useful in are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in tesponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and annoatic annoatic annoatic firman plant in medical disorders. Assetting and to produce other types of fata and products dependent on DNA and annoatic annoatic annoatic firman firman part in the father of the present novel human plant and products dependent on DNA and the products dependent on DNA and the product of the product of the present of the present plant of the present on DNA and the present of the present of the present of the present of the present of the present on DNA and the present of the prese Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder; ss. New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess DNA encoding novel human diagnostic protein #26912. diagnostic coding sequences of the invention. ```

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags (or identifying expressed genes. (I) is useful in gene therapy techniques of correstore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. (The polypeptide and polynucleotide sequences have applications in cresponsible for genetic disorders or other traits to assess biodiversity and or produce other types of data and products dependent on DNA and diagnostic coding sequences. AAS64197-AAS94564 represent novel human cold sequences and to this patent did not appear in the printed coperation, but was obtained in electronic format directly from WIPO specification, but was obtained in electronicat ftp.wipo.int/pub/published\_pct\_sequences. Claim 1; SEQ ID No 21590; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (I or identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical magning of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in clasponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences. Assetled? Assetled represent novel human codis sequences and to produce other types of the invention.

CNOTE: The sequence data for this patent did not appear in the printed sequences. The sequence of the invention of security from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1833 GGAACAGTAGCTGAATACAACGGCTATCACGTTGTGTTTGCTCTTGCGGGAACCCGAAAG 1774

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, configurates chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags of or identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polyucleotide sequences have applications in capanostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity min, and to and to produce other types of data and product dependent on DNA and main, and the produce of the pr 8 amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO 937 tggaagaatgtaggtccaatttttggctataattctacc----gcggtttcacaagaa 990 ggacaagttgctaattggaatggctatcaacttgtcatcgcaatgatgggaattccaaac 876 caaaatgataatcatatctatcttatataaaagtatggtgataatgaattaagtcat 936 307 acgctgatgacacatcaatctacatgttttatcaaaagctggaaaaacgcgggccgtgtc 90; 3.0%; Score 70.2; DB 23; Length 2079; 46.9%; Pred. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome polynucleotides are also used in diagnostics as expressed sequence tags (C for identifying expressed genes. (I) is useful in gene therapy techniques (C to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as inging of sites expressing (II) (I) are useful in medical activity of a food supplement. (II) and its binding partners are useful in medical c disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in the produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and cold sequences. AAS64197-AAS4564 represent novel human of diagnostic coding sequences of the invention.

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags (or identifying expressed genes. (I) is useful in gene therapy techniques (I) restore normal activity of (II) or to treat disease states involving (I) (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity cand to produce other types of data and products dependent on DNA and diagnostic coding sequences. AAS64197-AAS94564 represent novel human cod diagnostic coding sequences of the invention.

CNOVE: The sequence data for this patent did not appear in the printed confined in electronic format directly from WIPO

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, or polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving cuantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. C maging of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polynuclectide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and classing sequences of the invention.

C amino acid sequences AAS6419-AAS94564 represent novel human consequence data for this patent did not appear in the printed system of the invention.

C hote: The sequence data for this patent did not appear in the printed system of the printed county was obtained in electronic format directly from WIPO xxx

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

STRFTF
S.mutans fructosyltransferase gene, complete cds.
M18954
M18954.1 GI:153635
fructosyltransferase.
Streptococcus mutans (strain GS5) (clone: pSS22 and pTS102.) DNA.
Streptococcus mutans
Bacteria; Firmicutes; Bacillus/Clostridium group; Streptococcaceae;
                                                                                                                                                                                                                                                                                                                                                                                                                                   Sireptococcus.

Sireptococcus.

(bases 1 to 4305)

Shiroza,T. and Kuramitsu,H.K.
Sequence analysis of the Streptococcus mutans fructosyltransferase
gene and flanking regions

Clones are derived from the Trypanosoma brucei GUTat 10.1 sheared

DNA library constructed at TIGR. Clones will be available for distribution through ATCC. Sheared DNA end sequences search page: http://www.ligr.org/tdb/mdb/tbdb/.

Seq primer: M13-Reverse

Class: shotgun.

/nstitute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically
sheared to give a tight size distribution (approx 2 kb).
                 El-Sayed, N., Zhao, S., Zhao, H., Gill, S., Suh, E., Malek, J., Fujii, C., Gerrard, C., Leech, V., de Jong, P., Ullu, E., Melville, S., Donelson, J., Fraser, C. and Adams, M.
betermination of clone end sequences from Trypanosoma brucei GUTat 10.1 sheared DNA library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
                                                                                                                                                                                                                                                                                           Email: nelsayed@tigr.org
Clones are derived from the Trypanosoma brucei GUTat 10.1 sheared
DNA library constructed at TIGR. Clones will be available for
distribution through ATCC. Sheared DNA end sequences search page:
http://www.tigr.org/tdb/mdb/tbdb/.
Seq primer: Ml3-Forward
Class: shotgun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1310 gtagaaagtaacaattacaacggtgttgctgaagttaatactgaacgtcaagctaatggt 1369

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC Library was generated from A. gambiae EEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed saxes of larvae. The BAC
library was constructed at Texas A&W University BAC Center
                                                                                                                                                                                                                                             Anopheles gambiae

Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from microorganisms that inhabit library was constructed at Texas A&W Universty BAC Center University, College Station, Texas A&W Universty BAC Center From Microorganisms and HindIII

/note="Vector: pUC18; Site_l: Smal; Constructed at The Institute for Genomic Research (TIGR). Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (approx 2 kb). The v + i method used for the libraric construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999).

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA.from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M Universty BAC Center
University. College Station, Texas 77843-2123, USA using a HindIII
